Description Hi all, I was hoping that you could clarify a few things regarding the weighting of the jk datasets. As far as I have been able to tell looking at the dataset and data directories, the datasets don't include any weight variables; is this correct? If so, would it be appropriate to use the weight variable provided in the COVID datasets in combination with variables taken from the jk datasets in analysis aimed at comparing pre- and post-covid responses? Thanks for your help, Charlotte

Dear Charlotte,

These jk_ data files are only meant to be used in conjunction with the Covid19 data files and so the weights in Covid19 datafiles should be used.

Best wishes,
Understanding Society User Support
