Description Hi there, I want to run some longitudinal analysis which includes a variable for participants' highest qualification at each specific wave. Is there a variable which accounts for this? I'm unsure what the difference between hiqual_dv and qfhigh_dv is and whether either of these fulfill that criteria. Thanks

Hello,

hiqual_dv and qfhigh_dv are longitudinally produced, that is, at each wave these are the highest qualification attained by that wave. While hiqual_dv is the highest educational qualifications, qfhigh_dv includes vocational qualifications. For details about these variables please see the variable notes: https://www.understandingsociety.ac.uk/documentation/mainstage/dataset-documentation/variable/hiqual_dv https://www.understandingsociety.ac.uk/documentation/mainstage/dataset-documentation/variable/qfhigh_dv

Best wishes,

- File Look_up hiqual_dv.pdf added

You may find this document which shows how the different qualifications are matched onto the derived variables.
