Description			
<p>I am working with the 2019 mainstage data (baseline for COVID waves) and want to know which variables to use to identify which diagnosed health conditions an individual currently has. If this is not possible, then can we identify whether they have ever had that condition, without needing to look back at previous waves?</p> <p>For example, does jk_hcondncode1 tell us how many people have asthma now, how many people have ever reported having asthma (since Wave 1) or just how many people have reported having asthma for the first time in Waves 10/11?</p> <p>One of the FAQs on the website says that there has been a change in how health condition information is collected from Wave 10, but no further details are given.</p> <p>Thank you.</p>

- File FAQ on HCONDS_addw10changes_20210511.pdf added
- Status changed from New to Feedback
- % Done changed from 0 to 80
- Private changed from Yes to No

Hello,

We have updated the health conditions FAQ to include the changes that were made in Wave 10. The note is attached. Please take a look and let us know if that is clear. If not, please ask any further questions you have.

Best wishes,
Understanding Society User Support Team

Hello,

Thanks for your clarification. Given this, am I correct in thinking that you cannot estimate the incidence rate for a listed health condition in W1-9 as it does not ask previous respondents if they still have health conditions identified in previous waves?

Thanks,
James
