gigempjob2

<b>Category:</b>	Questionnaire content		
<b>Description</b>  In the standard licence file, gigempjob2 in o_indresp has n=915 'yes' counts but the same variable has n=1133 'yes' counts in o_employment. The gig job questions, according to the questionnaire, are looped for all jobs, if people have multiple jobs. I assume that indresp relates to the main job and the employment file to an aggregate across all jobs? Is it possible to get gigempjob2 for each job?  Many thanks for clarification.  Darja

Hi Daria,

The O\_employment file is a long-format dataset in which each row represents a single job. The unique identifier is the combination of pidp and o\_jobcode, where o\_jobcode is the job number. Therefore, you can check the value of o\_gigempjob2 for each o\_jobcode.

I hope this helps.

Best wishes,
