Description			
<p>Hi, I need some advice on analyzing a subpopulation of the sample. Specifically I am only analyzing individuals that were aged 16-24 in the first wave and who have a 'full interview' at each subsequent wave.</p> <p>Previously I had been just been applying a filter to the data and still using the sample weights, but it has occurred to me that this might not be statistically sound thing to do. What do I need to do in order to analyze this subpopulation correctly using spss? Also, would I need to adjust the sample weights manually at some point?</p> <p>Thanks, Stef</p>

All our weights are designed for analysis of the whole population on any population subgroup. Apologies for taking a long time to answer your question. On behalf of the team, Jakob
