I have a query re an output for ethnicity that a colleague has run.

The output below is for ethnicity. There appears to be 43,356 for inapplicable which seems to be high. Is this correct? Is it possible for someone to explain please?

Many thanks

Angela

Please use the variable c_racel_dv. This question was asked of all adult respondents in wave 1 and after that only of the new entrants. So, c_racel will only have nonmissing values for the new entrants who answered this question. The variable racel_dv consolidates this information collected at different waves.

Best wishes, On behalf of the team.
