<b>Description</b> I'm interested in looking at the Youth self-completion (10-15 years old) data across wave 1 and wave 2 (interim release). I've noticed that there are no weights described in the documentation for looking at the youth self-completion data longitudinally (only cross-sectionally). I just wanted check if any appropriate weights had been developed for this purpose. Thank you for your help.

No such weights were developed for the interim release. We are considering to release such weights in the future, although we are still thinking about best forms for such weights given that the longest time for youth self-completion is 6 years (years 10 to 15).
