### Households which were "withdrawn from field" but still present in \_hhresp file

<b>Description</b> Hi,  I have been using the w_callrec datafiles to look at the number of calls that were made to a household, something which is recorded under the variable w_ivtnc. I merged this variable into the w_hhresp datafiles for each wave, but then I noticed something surprising. The number of calls received by a household ranges from, at a maximum, 32, to a minimum of 0. In the dataset documentation for the w_ivtnc variable it is explained that "This indicator assumes a value of zero [if] no calls have been made because the household was withdrawn from the field after issuing". And indeed, in the w_callrec datafiles, the value 0 for this variable is labelled "no call, withdrawn from field". I was assuming that if no calls had been made to a particular household because it was withdrawn from the field, this household would not show up in the relevant w_hhresp file. But this is not the case. There are around two thousand households in each wave which have a record in the _hhresp file (including responses on all variables included in my study) but for whom the _ivtnc variable is 0 - "no call, withdrawn from field". I did a bit of further digging, and it appears that most of these supposedly withdrawn but still present households are located in Northern Ireland. Is there an explanation for this? I had a look if the User Guide mentions anything about this but couldn't find anything (although it is possible I've not looked hard enough!)  Many thanks,  Sanne

Hi Sanne,

the 0 code includes households for whom the issue number and or number of calls made is missing or has been incorrectly transmitted from the fieldwork. This practise is under review. For the time being, you could recode this as "at least one call made" for those households that participated in an interview.

On behalf of the Understanding Society team,  
Gundi
