how do I transform waves as time measurement into years?

Description			
Hi everybody,			
I have a quick question concerning the time dimension of the panel data set when using Understanding Society. Waves are defined from 1-5, but when I define some of my variables I need a calendar year, such as 2010. I found `w'_istrtdaty, which gives you the beginning year of the interview if I properly understand it. But when I write xtset pidp year I receive an error message telling me that there are repeated time values within panel.			
I am afraid there are two questions I am raising here. First of all, why does the error message come up? Is it a measurement error in the 'w'_istrtdaty variable? Secondly, how can I transform waves in USoc into years properly? I need an annual measure!

The fieldwork period for each wave stretches over two years. While the aim is to interview everyone one year apart, the actual interview date may be a couple of months around the intended interview month. So, you could have someone being interviewed in January 2011 as part of Wave 2 and December 2011 as part of Wave 3. For these cases, in your long file of five waves, you will find that their interview year is the same for two consecutive waves as a result you will get the above error message.

Best wishes,
Alita

Dear Alita,
thank you so much for your fast reply, of course I appreciate that very much.
What you write above clears up a few things for me, one question that remains though, and I am not sure if this is the appropriate forum for this question, is that I am not sure how to now construct a year variable. The interview periods comprise the years 2009, 2010, 2011, 2012, 2013, and 2014 with waves 1-5. How are you supposed to match waves with years? And I need a year number, I cannot work with a number 1-5. Why not? Well, because I have for instance, Yr2uk4, the year a person came to the UK in my data set. To construct another variable with Yr2uk4, I need some sort of annual measure. I hope this makes sense, comments and thoughts are very much appreciated. Thank you!

Hello Nico,

It is difficult to give a general answer to your question. If you are then interested in doing longitudinal analysis with year instead of wave as the time variable you will need to decide what to do with the problem cases discussed above. One option would be to change the interview year for the problem cases, using the month to determine the year. So, in the above example you could impute the Wave 3 interview year to 2012 as it was Dec 2011. If you want to construct a variable such as time since arrival to UK by using the difference of the interview year variable, w_istrtdaty, and Yr2uk4 for each wave, then for the problem cases you can use a similar technique to determine the interview year. Note these are only suggestions and their suitability depends on the analysis.

Hope this helps.
Alita
