<b>Description</b> There is a file called a_natchild containing the information about the natural children including birth weight, gestational age, and breastfed. There is another file called a_child containing information about child's identifier(pidp), child's age (a_dvage). I had a hard time trying to link those two files together. a_natchild only provided a_childno, which is the birth order. But I don't know which kid that's apply for (e.g. pidp). Is the a_childno from a_natchild same as the a_childpno ? Do you have any suggestions about how to link the birthweight to each child? Many thanks			

### History

#### #1 - 11/02/2017 04:31 PM - Stephanie Auty

- Status changed from New to In Progress

- File Linking\_a\_natchild\_indall.do added
- % Done changed from 10 to 80

We sincerely apologise for the delay in responding to this issue. The delay was partly due to investigating this issue and finding appropriate solutions.

The file A\_NATCHILD includes information about natural children as reported by their parents and so each row (in most cases) is at the parent-child level. The parent can be identified using A\_HIDP and A\_PNO and the child can be identified using A\_HIDP A\_LCHNO where A\_LCHNO is the PNO of the child. So, ideally each row should be uniquely identified by A\_HIDP A\_PNO A\_LCHNO. However, there are a few cases where there are duplicates. In the attached Stata syntax we check such cases and provide suggestions about tackling this issue for those interested in matching resident biological children in A\_NATCHILD with valid birth information with their information in A\_INDALL. The Syntax file includes comments which explain every step. If you have any questions or identify any problems please let me know.

Best wishes,  
Alita
