Description			
<p>Hi, I had the chance to attend the course. I am on exercise 3 matching individual data in long format which I can do and I can do the loops but to balance the panel it has instructions on how to do this when appending just two waves. Say that I want to use all the waves? When do I balance the panel. I've tried using xtset after appending all the waves and it doesn't work. So is it done as part of the loop? When do I create the transition variables before or after I have all the waves appended in a long format.</p> <p>Thanks Maria</p>

Dear Maria,

xtset should be used after appending all of the waves. Please check that each wave only appears once in the dataset, as having a wave appear twice would stop xtset from working.

Best wishes,
Stephanie Auty - Understanding Society User Support Officer
