Description Hi Stephanie I have merged individual level data on the BHPS across waves and am having difficulty merging with the house price data set. The rule is that am i am suppose to find a unique macro identifier for the two data sets in which am using "region" as you advised duringUndSoce training but the problem is that it still doesn't merge. It is suppose to work using merge 1: m region using longfile.dta But it keeps saying the variable does not uniquely identify observations in both data sets. i also converted "region" from string to numeric Please would really appreciate your help. Apparently the merged data set which you helped me with during the training 2 weeks ago does not work with my Stata version 13.0 Will be so grateful for your kind help.

Dear Oluwaseun Fajana,

Your datafile shows that the region variable is missing so please try creating it again.

Our remit at the User Forum is to answer queries related to Understanding Society data and provide general advice about how to manage the data. Given the number of users we have I'm afraid we cannot advise on individual users' analysis syntax specifically.

We do not provide training in specific statistical software or statistical methods but there are a wide range of courses available - NCRM provide a use list of course held across the country <http://www.ncrm.ac.uk/training/>.

Best wishes,
Stephanie Auty - Understanding Society User Support Officer
